

## ABSTRACT OF THE DISCLOSURE

A test system having a test module for performing a test of one of plural databases. The test is performed using a common file. The file name of the common file is identified with a data source routine, which identifies the file name based on received first and second values. The first value is a predetermined string that is part of the file name of the common file, and the second value represents one of the plural databases. The file name of the common file is generated based on the concatenation of the first and second values.
